**Ripple & Noise Test: (Twisted Pair Test Method 20MHz bandwidth)**

1. 12# twisted pair to connect, Oscilloscope bandwidth set as 20MHz, 100M bandwidth probe, terminated with 0.1uF polypropylene capacitor and 10uF high frequency low resistance electrolytic capacitor in parallel, oscilloscope set as Sample pattern.

**2. Output Ripple & Noise Test Method:**

Input terminal connect to power supply, output terminal connect to electronic load through jig plate, Use 30cm±2 cm sampling line, Power line selected from corresponding diameter wire with insulation according to the flow of output current.

**Application reference:**

1. It is recommended to output a minimum of 10% load or connect an electrolytic capacitor with a high-frequency resistance above 470uF, otherwise it will increase the output voltage ripple;
2. It is recommended that the load imbalance of dual output products is less than ±5%;
3. The maximum capacitive load is the result of the pure resistance full load condition test;
4. Our company can provide overall power supply solutions, or product customization;
